EDUCATION

University of Washington

Expected June 2028

B.S., Computer Science & Software Engineering | Minor, Data Science

TECHNICAL & ANALYTICAL SKILLS

Languages: Python, Java, SQL, JavaScript, TypeScript, C++

Data & Analytics: SQL, Python, Amazon Redshift, Tableau, Amazon QuickSight, Excel, Langfuse, A/B Testing, KPI Development, Data Validation, Dashboarding, Data Visualization

Development: React, React Native, Node.js, Git, GitHub

Product & Design: Figma, User Research, Requirements Gathering, Roadmapping

EXPERIENCE

GoDaddy

June 2026 – Present

Data Analytics Intern, Product | Kirkland, WA

- Built a closed-loop LLM agent evaluation and observability system using Langfuse to analyze production conversations, measure response quality, and identify routing, retrieval, and response failure patterns.
- Built SQL and Python pipelines in Amazon Redshift to monitor engagement, conversion, and KPI performance across 15 live product experiments.
- Automated experiment analysis, metric calculation, and stakeholder reporting through reusable AI-assisted workflows, reducing turnaround time from two weeks to under one hour.
- Developed a taxonomy-based analysis pipeline that tracks conversation topics, business verticals, customer segments, conversion rate, quality, failure rates, root causes, and severity over time.
- Created Amazon QuickSight dashboards and executive presentations that translated experiment and agent-performance results into recommendations informing three shipped product decisions.

WIRED Studio

March 2026 – Present

Co-Founder & Design Engineer | Seattle, WA

- Co-founded a design-engineering studio building responsive digital platforms for student organizations and local nonprofits.
- Lead client engagements from discovery through delivery, translating user and stakeholder needs into product requirements, prioritized roadmaps, user flows, implementation plans, and delivery timelines.
- Design and develop user-centered web experiences using React, TypeScript, JavaScript, Figma, Git, and GitHub, balancing usability, accessibility, technical feasibility, and project constraints.
- Conduct stakeholder interviews and synthesize qualitative feedback into product requirements, design iterations, feature priorities, and actionable recommendations.

PROJECTS

[Brew.](#) | React Native, TypeScript, Google Maps Platform, Supabase, SQL, Figma, Git/GitHub

- Building a social café-discovery mobile application that helps users find, evaluate, and save cafés based on preferences, location, proximity, and occasion-based needs.
- Developed recommendation and search logic that filters and ranks café results using user preferences, geographic proximity, categories, and venue attributes.
- Integrated Google Maps Platform to support map-based discovery, place search, venue photos, directions, and initial review data within the application experience.
- Designed and implemented end-to-end user flows for search, recommendations, saved lists, reviews, profiles, and location services; iterated on product requirements and interface designs using user research and usability feedback.

[Habitat](#) | React Native, Expo, TypeScript, FastAPI, Supabase, HealthKit, MobileCLIP, Figma

- Built a gamified iOS habit-tracking prototype in a four-person team during a 48-hour hackathon, transforming HealthKit activity data into an interactive “island world” and avatar-health experience.
- Led frontend implementation from Figma to React Native, building the onboarding flow, signup screen, pixel-avatar experience, island-health visual language, four-state sprite system, and state-based animation and color behavior.
- Integrated HealthKit-based habit signals for steps, sleep, and screen time; collaborated on a photo-verification workflow for non-sensor habits using a FastAPI service, quantized MobileCLIP model, and Supabase for authentication and habit data.
